

micro-pigmentation

an MCA technician

Alternatively, there are medical uses for this procedure. It has been greatly received by post breast operation patients for Areola Restoration. This is a Micro-Pigmentation technique that is used to create and colour the nipple and areola area, creating a 3D effect, to help disguise any scarring and improve appearance after this traumatic surgery. It can also benefit those with thinning or receding hair, using very fine strokes to fill an area giving a softer, natural effect with a treatment known as Hair Enhancement.

It is also a very popular method of Tattoo Removal.

The removal practice is by Micro-Pigmentation which utilises a unique mechanism that softens the pigment of the skin and then draws the ink out through the surface over a period of treatments.

MCA also known as 'dry needling', is used to detach the scar from the skin below, this stimulates the skin under the scar to form new connective tissue with young collagen fibres and is based on the body's regeneration capacity. The 'dry needling' ensures that the fibres around the scar contract, making the problem area smoother. Therefore the body renews itself,

Micro-Pigmentation and Multitrepannic Collagen Actuation (MCA) are new cutting edge techniques in both medical and cosmetic procedures. MCA was derived from Micro-Pigmentation but both use a similar principle and similar method.

Using the same method and having equally outstanding results, Micro-Pigmentation works on putting pigment into the skin and MCA works on stimulating the body's natural ability to heal.

Micro-Pigmentation works using a tattoo type method of applying a natural organic pigment into the dermal layer of the skin, enhancing and improving the natural appearance.

Semi-permanent make-up is increasing in popularity around the world and has very effective results.

A Technician is trained to apply everything from a lip or eyeliner to eyebrows and more.

resulting in totally regenerated skin as pre-scar. MCA works with almost any face or body scar tissue and has proven success with acne scarring, burn scars and even stretch marks.

Sharon Gillham is a fully qualified & insured professional for Micro-Pigmentation an MCA Technician.

She has over seven years experience and trained in England at The British School of Dermagraphic Art (Finishing Touches), a school which provides training for doctors and nurses at The Royal Marsden Hospital, London.

Sharon is currently working with three leading plastic surgeons at St. Thomas' Hospital and London Bridge Hospital in the UK and also in Spain. She has had proven success with all treatments she provides and is constantly updating her skills and knowledge so that all procedures are at the top level of the industry. She is very enthusiastic about the work she does and is confident in the technique. Her most popular treatments are semi-permanent make-up and tattoo removal although her aim is to work more in the paramedical field with procedures such as the Areola Restoration.
